

Per-finding decision: surface finding i only if $\hat{p}_i \geq \tau^* = r/(q + r)$

True Positive surfaced
prob p_i : finding IS a vulnerability
LLM fixes with prob q
Haiku: $q=0.23$ | Qwen: $q=0.28$

→ JointPass improves

False Positive surfaced
prob $1 - p_i$: finding is NOT a vulnerability
LLM "fix" causes regression with prob r
Haiku: $r=0.08$ | Qwen: $r=0.53$

→ JointPass degrades

Optimal threshold: $\tau_{\text{Haiku}}^* = 0.08/(0.23 + 0.08) = 0.26$ (low threshold) $\tau_{\text{Qwen}}^* = 0.53/(0.28 + 0.53) = 0.66$ (filter low-precision rules)
